这个问题基本上是Spring在启动的时候, 某个东西重复被初始化(请仔细检查自己有没有重名的接口, 我好几次都是接口重名导致的), 导致内存溢出或者其它。我们在编程的过程中, 一定要细心, 避免类似的错误发生。

The screenshot shows a Java code editor with several tabs at the top: SalesContractClient.java, ReportStatisticsExportExcelClient.java, ReportStatisticsClient.java (which is the active tab), Action.java, and ActionRecomm... Below the tabs, there is a class definition:

```
public interface ReportStatisticsClient {
```

Underneath, there are two sections of code, each with a red box highlighting a specific annotation. The first section is annotated with `@PostMapping("/sales/salesYearSaleForm/excel")`. The second section is also annotated with `@PostMapping("/sales/salesYearSaleForm/excel")`. Both sections also have `@ApiOperation` annotations. A red box highlights the word "重名" (Redundant) in the center of the code area.

```
    @PostMapping("/sales/salesYearSaleForm/excel")
    @ApiOperation(value = "年销售报表", notes = "salesYearSaleForm")
    Result<Object> yearSaleForm(@RequestBody @Valid SalesPlanExecuteCars param);

    @PostMapping("/sales/salesYearSaleForm/excel")
    @ApiOperation(value = "年销售报表(第二版)")
    Result<YearStatistics> yearStatisticsList(@RequestBody @Valid QueryYearStatistics param);

    @PostMapping("/sales/firstHalfYearStatistics/list")
    @ApiOperation(value = "上半年年销售报表")
    Result<FirstHalfYearStatistics> firstHalfYearStatisticsList(@RequestBody @Valid QueryYearStatistics param);
```
