## [XMAN2018排位赛]Dragon Quest

elf文件, 无壳, ida分析

main函数, 读取输入, start\_quest函数验证输入, 根据返回值判断输入是否正确

```
30  std::operator<<<std::char_traits<char>>(
31  &std::cout,
32  (unsigned int)"Enter the dragon's secret: ",
33  "Enter the dragon's secret: ");
34  fgets(&input, 257, stdin); // 读取输入
35  std::allocator<char>::allocator(&v8, 257LL);
36  std::string::string(&v9, &input, &v8);
37  std::allocator<char>::~allocator(&v8);
38  std::string::string((std::string *)&v7, (const std::string *)&v9);
39  v3 = start_quest((std::string *)&v7); // input->v9->v7, start_quest验证v7, 根据返回值v3判断输入是否正确
40  std::string::~string((std::string *)&v7);
41  if ( v3 == 0x1337 ) // v3要等于0x1337
42  {
43  std::string::string((std::string *)&v6, (const std::string *)&v9); // input->v9->v6
44  reward_strength((std::string *)&v6); // 打印flag
45  std::string::~string((std::string *)&v6);
46  }
47  else
48  {
49  std::operator<<<std::char_traits<char>>(
50  &std::cout,
51  (unsigned int)"\n[-] You have failed. The dragon's power, speed and intelligence was greater.\n",
52  v4);
```

进入start\_quest函数，首先是给hero数组添加元素，检验输入的长度是否为28，输入长度等于28则v7为0，否则v7为1

```

24  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_100); // 给hero数组添加元素
25  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_214);
26  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_266);
27  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_369);
28  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_417);
29  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_527);
30  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_622);
31  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_733);
32  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_847);
33  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_942);
34  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1054);
35  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1106);
36  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1222);
37  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1336);
38  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1441);
39  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1540);
40  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1589);
41  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1686);
42  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1796);
43  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1891);
44  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_1996);
45  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2112);
46  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2165);
47  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2260);
48  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2336);
49  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2412);
50  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2498);
51  std::vector<int, std::allocator<int>>::push_back(&hero, &secret_2575);
52  v7 = std::string::length(input) - 1LL != legend >> 2; // 由下面判断可知，v7需要为0，于是input的长度为28
53  if ( y26 < 10 || (((_BYTE)x25 - 1) * (_BYTE)x25 & 1) == 0 )

```

往下走，由于需要start\_quest返回0x1337，则需v7为0，即输入的长度等于28

sanitize\_input函数对输入进行检验，由变量值传递可知，sanitize\_input函数也要返回0x1337

```

95 LABEL_14:
96     *v9 = legend >> 2;
97     }
98     }
99     else // v7为0
100    {
101        if ( y26 >= 10 && (((_BYTE)x25 - 1) * (_BYTE)x25 & 1) != 0 )
102            goto LABEL_15;
103        while ( 1 )
104        {
105            input_ = input;
106            std::string::string(v8, input);
107            if ( y26 < 10 || (((_BYTE)x25 - 1) * (_BYTE)x25 & 1) == 0 )
108                break;
109 LABEL_15:
110            std::string::string(v8, input);
111        }
112        v6 = sanitize_input(v8, input_); // 对输入进行检验，返回值赋给v6，v6->v9->v5，最终返回
113        if ( y26 >= 10 && (((_BYTE)x25 - 1) * (_BYTE)x25 & 1) != 0 )
114            goto LABEL_16;
115        while ( 1 )
116        {
117            *v9 = v6;
118            std::string::~string(v8);
119            if ( y26 < 10 || (((_BYTE)x25 - 1) * (_BYTE)x25 & 1) == 0 )
120                break;
121 LABEL_16:
122            *v9 = v6;
123            std::string::~string(v8);
124        }
125    }

```

```

126 do
127     v5 = *v9;
128     while ( y26 >= 10 && (((_BYTE)x25 - 1) * (_BYTE)x25 & 1) != 0 );
129     return v5;
130 }

```

[https://blog.csdn.net/weixin\\_45582916](https://blog.csdn.net/weixin_45582916)

进入sanitize\_input函数，主要的逻辑为，输入进入transform\_input函数处理，返回值与hero数组比较

```

v31 = (char *)std::string::operator[](input, index); // 从input中取一个字节
if ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 )
{
LABEL_71:
    if ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 )
        goto LABEL_114;
    while ( 1 )
    {
        *(_DWORD *)v40 = *v31;
        if ( y4 < 10 || (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) == 0 )
            break;
LABEL_114:
        *(_DWORD *)v40 = *v31;
    }
}
*(_DWORD *)v40 = *v31; // v31->v40
if ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 )
    goto LABEL_71;
while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 )
;
std::vector<int, std::allocator<int>>::push_back(v42, v40); // v40被添加到v42数组
do
    v30 = y18 < 10 || (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) == 0;
while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 );
if ( !v30 )
LABEL_74:
    *v37 = *v41;
    if ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 )
LABEL_99:
    *v37 = *v41;
    v1 = v37;
    *v37 = *v41;
    v29 = *v1;
    v28 = y18 < 10 || (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) == 0;
    if ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 )
        goto LABEL_99;
    if ( !v28 )
        goto LABEL_74;
    v27 = std::string::length(input);
    do
        v26 = y18 < 10 || (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) == 0;
    while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 );
    if ( !v26 )
LABEL_75:
        *v37 = (v27 >> 40) & v29 | 0x1C;
        v2 = v37;
        *v37 = (v27 >> 40) & v29 | 0x1C;
        v25 = *v2 != 0;
        if ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 )
            goto LABEL_75;
        while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 )

```

```

;
if ( v25 )
{
do
    index_ = *v41;
while ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 );
v23 = (int *)std::vector<int,std::allocator<int>>::operator[]((unsigned int)&hero, index_);// 从hero中取一个字节
do
    v22 = y18 < 10 || (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) == 0;
while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 );
do
    v21 = *v23; // v23->v21
while ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 );
std::vector<int,std::allocator<int>>::vector(v36, v42);// v42赋给v36
do
    v20 = y18 < 10 || (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) == 0;
while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 );
while ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 )
;
while ( y4 >= 10 && (((_BYTE)x3 - 1) * (_BYTE)x3 & 1) != 0 )
;
v19 = transform_input(v36); // 对v36处理, 返回到v19
if ( y18 >= 10 && (((_BYTE)x17 - 1) * (_BYTE)x17 & 1) != 0 )
    goto LABEL_79;
while ( 1 )
{
    v18 = v21 == v19; // v19与v21比较

```

进入transform\_input函数，主要的逻辑为，取出输入的一个字节input[i]，v16初始值为0，v16每次加上input[i]，然后返回v16，与hero数组的元素比较

```

69     goto LABEL_32;
70     while ( 1 )
71     {
72         v2 = (_DWORD *)std::vector<int,std::allocator<int>>::operator[](input, *(signed int *)index);// v2=input[i]
73
74         *(_DWORD *)v16 += *v2; // v16初始值为0, 每次加input[i], v16->v8, 最后返回v8
75         v11 = y12 < 10 || (((_BYTE)x11 - 1) * (_BYTE)x11 & 1) == 0;
76         if ( y2 < 10 || (((_BYTE)x1 - 1) * (_BYTE)x1 & 1) == 0 )
77             break;
78 LABEL_32:
79         v5 = (_DWORD *)std::vector<int,std::allocator<int>>::operator[](input, *(signed int *)index);
80         *(_DWORD *)v16 += *v5;

```

已知hero数组，写逆运算脚本即可得到flag

```

hero=[0x64,0xd6,0xa,0x71,0xa1,0xf,0x6e,0xdd,0x4f,0xae,
      0x1e,0x52,0xc6,0x38,0xa1,0x4,0x35,0x96,0x4,0x63,
      0xcc,0x40,0x75,0xd4,0x20,0x6c,0xc2,0xf]
n=0
flag=""
for i in range(len(hero)):
    tmp=hero[i]-n
    n+=tmp
    flag+=chr(tmp%128)
print(flag)
#dr4g0n_or_p4tric1an_it5_LLVM

```

exe程序，运行后输入，无壳，ida分析

main函数，读取输入，检验输入的长度是否为38，对输入进行三次变换，最后与Str2比较

```
14  _main();
15  strcpy(Str2, "EmBmP5Pmn7QcPU4gLYKv5QcMmB3PWHcP5YkPq3=cT6QckkPckoRG");
16  puts("Hello, please input your flag and I will tell you whether it is right or not.");
17  scanf("%38s", &input);
18  if ( strlen(&input) == 38 // 输入的长度为38
19      && (v3 = strlen(&input), (unsigned int)encode_one(&input, v3, &v10, &v12) == 0)// 常规base64
20      && (v4 = strlen(&v10), (unsigned int)encode_two(&v10, v4, &v9, &v12) == 0)// 分组换位置
21      && (v5 = strlen(&v9), (unsigned int)encode_three(&v9, v5, &Str1, &v12) == 0)// 类似凯撒，向右移三位
22      && !strcmp(&Str1, Str2) ) // input->v10->v9->Str1, Str1与已知的Str2比较
23  {
24      puts("you are right!");
25      result = 0;
26  }
27  else
28  {
29      printf("Something wrong. Keep going.");
30      result = 0;
31  }
32  return result;
33 }
```

[https://blog.csdn.net/weixin\\_45582916](https://blog.csdn.net/weixin_45582916)

三次变换都很容易理解，分别是常规base64，分组换位置，以及类似凯撒的右移三位

写逆运算脚本即可得到flag

```
import base64
str2="EmBmP5Pmn7QcPU4gLYKv5QcMmB3PWHcP5YkPq3=cT6QckkPckoRG"
data=[]
for c in str2:
    if c.isdigit():
        data.append((ord(c)-48-3)%10+48)
    elif c.isupper():
        data.append((ord(c)-65 - 3) % 26 + 65)
    elif c.islower():
        data.append((ord(c)-97 - 3) % 26 + 97)
    else:
        data.append(ord(c))
flag=[0]*len(data)
flag[0:13]=data[13:26]
flag[13:26]=data[39:len(data)]
flag[26:39]=data[0:13]
flag[39:len(flag)]=data[26:39]
print(base64.b64decode(''.join(chr(i) for i in flag)))
# GWHT{672cc4778a38e80cb362987341133ea2}
```

## [watevrCTF 2019]Repyc

.pyc文件，用uncompyle6反编译得到源代码，python2会检测为非ascii码，换成python3即可

```
佻 = 0
偲 = ~佻 * ~佻
儇 = 偲 + 偲

def 夔(夔):
    夔 = 佻
    夔 = 佻
    夔 = [佻 * 儇 ** (儇 * 儇)]
    夔 = [佻 * 100]
    夔 = []
    while 夔[0][佻] != '豎':
```

```

    괘[龜[淺]]:
        )

    range(len( 괘[龜[佻]])):
        [佻] != 괘[龜[偊]]:
            ] = 偊
            괘[龜[淺]]
            ppend(굴)

        ':
            range(len(괘[龜[佻]])):
                = chr(ord(괘[龜[佻]][i]) ^ 괘[龜[偊]])
                ]] = 괘

            '괘':
                ''

            i in range(len(괘[龜[佻]])):
                괘 += chr(ord(괘[龜[佻]][i]) - 괘[龜[偊]])

            龜[佻] = 괘

            ㄱ == '땡':

            if 괘[龜[偊]] > 괘[龜[淺]]:

                굴 = 괘[龜[佻]]

                괘.append(굴)

```

```

if ㄱ == '땡':
    굴 = 괘[龜[佻]]
else:
    if ㄱ == '땡':
        굴 = 괘.pop()
    else:
        if ㄱ == '땡':
            if 괘[龜[偊]] >
                굴 = 龜[佻]
                괘.append(굴)

                continue
            else:
                if ㄱ == '괘':
                    괘[7] = 佻
                    for i in range(
                        if 괘[龜[
                            괘[7]
                            굴 =
                            괘.a

                        else:
                            if ㄱ == '괘
                                괘 = ''
                                for i in
                                    괘 +
                                    괘[龜[佻]
                                else:
                                    if ㄱ ==
                                        괘 =
                                        for
                                        괘[
                                        else:

```

运行后输入，调试发现，对输入的处理很简单， $input[i]=((input[i])^{135})-15$ ，即输入先异或135，再减去15，最后和那段长字符串比较，写脚本即可得到flag

```

res=""
æ0É×Úiá×iãÉBÉ0UáÉæ0×ÚÚiÉà×à0É×ÉÑU0ÉàB0É0ááÉBÉæ0×ÚÚiÉÓÚPÚiÉääBáÉáUÚÑÉBÉàUè0ÉiUáÉáBÚÉÓÚPÚiÉBáÉ×áá0ÚÚ\x97ÉiUáää0Ó\x9a0ÚÚ\x99á×ä0à@â«³£i²0Ë·±â"ë"
flag=""
for c in res:
    flag+=chr((ord(c)+15)^135)
print(flag)

## [2019红帽杯]calc

exe程序，运行后输入，无壳，ida分析

三次输入，对输入一顿运算，没看懂

参考网上别的师傅的wp，2019红帽杯 Writeup by X1cT34m

原来是在满足 $input\_2 < input\_1 < input\_3$ 的条件下，得到  $input\_1^{**3} + input\_2^{**3} + input\_3^{**3} == 42$ ，即三个整数的立方和等于42  
百度一下，果然有解

```
(-80538738812075974)**3 + 80435758145817515**3 + 12602123297335631**3==42
```

$$(-80538738812075974)^3 + 80435758145817515^3 + 12602123297335631^3$$

等于多少自己算？——他居然等于——等于42!

# 42 =

## $(-80538738812075974)^3$

## + $80435758145817515^3$

## + $12602123297335631^3$

[https://blog.csdn.net/weixin\\_45582916](https://blog.csdn.net/weixin_45582916)

将程序的三个sleep函数patch掉，按 $input\_2 < input\_1 < input\_3$ 的条件输入，得到flag

```
